Machining is one of the most important manufacturing processes, which remove unwanted
material in the form of chips from a workpiece. Material removal operations are among the most
expensive; in the U.S. alone, more than \$100 billion were spent on machining in 1999. These high
costs put tremendous economic pressures on production managers and engineers as they struggle
to find ways to increase productivity. Machining recommendations provided in this book cover
turning since it allows removing more material per unit of time and consuming more power at the
roughing operations than end milling, boring or drilling. Machining recommendations relate to cutting
speeds, feed rates, and depth of cuts. Such recommendations depend on the workpiece material
properties and the cutting tool material. Workpiece materials described in this book are the most
commonly used grades of carbon, alloy, stainless, tool, and maraging steels. Cutting tool materials
are cemented carbides, cermets, and ceramics.

Customer Reviews

There is a great discrepancy between the title of the book and its contents. The author focusses more on hardness conversion than really cutting parameters. There is only one chapter devoted to machining recommendations. The rest is filled with dull appendices which only reproduces excel spreadsheets. Not worth the money at all.

This book is great for learning.
